

Music Technology Project 1 (ELE00039C)

Final Report Feedback Sheet

STUDENT NAME: Dylan Soco

Introduction (from the assignment specification):

This report must be written individually and should detail your individual contribution to the project, as well as describing the group work as a whole. Your report should be between 4000 and 5000 words, and should include plentiful diagrams, such as concept sketches, detailed designs, code fragments, Pd patches, circuit diagrams, etc. Even though you will have been working on a good deal of technical material it is always important as engineers to be able to summarise a whole project in an executive summary; this report assignment gives you practice and feedback on that skill. The report should contain a front page with the School, Project Title, Date, Group Number, your name and the names of the other group members. The mark contributes 60% to your final mark for the module.

Marks and Feedback:

The following sections are weighted differently (as specified in the assignment, and at the end of the component name). They are each marked out of 10. Therefore the total of the marks column is a mark out of 60, which becomes your individual component mark for this assignment. For reference this is converted to a percentage for this component, which will appear on eVision and will be weighted as 60% of the module mark.

Component	Description	Feedback Comments	Mark
Product Concept (5%)	Main aim , who it's aimed at, marketing ideas, work breakdown .	It's great that you have set the scene of your project concept from the perspective of a company which has a clear goal. This description is good and explains your idea from a hardware and software console through to an innovative audio game. The work breakdown structure is good and your report gives confidence in the company's ability to deliver.	4.5/5
Description of Entire System (5%)	Technical overview , specification , console & game descriptions , use of audio and Pd .	You have given a very good perspective here by showing the system as it currently exists and by explaining what a user would need to do to get the system to work. You mentioned a specification but it is a short text based description and you might want to expand this into a more substantial set of tables, itemising each of the hardware components and software functionality. You have included a diagram of the system but it's quite hard to read and you might want to	4/5

		think about a diagram that is one notch simpler that explains the main functional components to a new reader.	
Analysis of Effectiveness & Future Plans (10%)	Achievements of the prototype compared to the specification in the initial report, further work needed as a group to complete the product prototype	Your analysis is very good in that you explain what you have achieved and how the product should be able to meet its original goals. It's also really good that you've added a section on accessibility and cost estimates as well. For your future plans you have given some ideas for further expansion, which are described well although you could make more of the diagrams here to help illustrate your points, for example coming up with marketing front cover. In terms of a technical analysis what would really be useful here and in future reports would be a tabulated form of your specification which includes a column, so that you can say whether each point has been met or not and what is still needed to do in order to complete it?	8/10
Individual Contribution (20%)	Clear statement of individual role and list of contributions to the project. Technical detail of individual contributions: describe all the work that you have personally contributed (or jointly worked on). If you have managed to produce code and configure hardware, then include details of code, photos and test data.	It is clear from the report and from your engagement throughout the project that you have put an enormous effort into this project. In the report you itemise your contributions to project lead as well as programmer. In an ideal world you would've had more help with the programming, which would have relieved some of your workload which we know was high. If it is any comfort the group members unanimously acknowledge your excellent contribution to the leadership. You have included some excellent overview and details here about the code. Overall very well done indeed. In fact you should look at creative ways to communicate with future group members to make sure you don't do quite as much and they do more.	18/20
Reflective Summary and Peer Review (10%)	Reflect on and summarise how well your group was structured , and how well it worked in practice. Time management and project planning. Draw on your personal progress each week. Comment on Gantt chart or Work Breakdown Structure , & Risk Management. Give a mark to ALL students in the group (including yourself) as if you had 100 shares to distribute. Add a short paragraph for each student justifying your share allocation. Fill your York Strengths grid at both the start and end of this project, and then comment on the progress as if in a written	It is good that you acknowledge the need to develop delegation more in future projects. This is initially difficult especially when you feel like you could do the job while yourself, but for mental and physical health reasons it is vital to explore these delegation skills. Your summary analysis is fair and well written. You have identified things that you want to do differently in the future which is one of the main names of a reflective	7/10

	answer to the interview question: <i>'Tell us about a recent project that you have been involved in, and how it has developed your skills.'</i>	summary. Your share allocation seems fair and is roughly in line with what the average of the other group members have given which shows a good understanding of the group dynamics. Unfortunately you have missed out the section on York strengths and have not included your before and after tables nor directly answered the required interview question.	
Overall Appearance and Structure (10%)	Try to produce something that you would be comfortable passing on to your boss. Follow the recommendations for report writing (available on the wiki) and use plenty of diagrams. You are strongly advised to get some feedback on your report's readability and format before submission.	This is a beautifully presented report. You are one of the few people to think about how a company might present their work. It is well constructed and very nicely illustrated. However there are a few things that would add to the professionalism. Even in a creative layout like this, each of the individual sections should have a hierarchical number, which appears in the contents page. Every diagram you include should have a number and a title and should be referred to in the text, such as (see Figure 1). Very importantly every diagram that is not directly created by you needs a credit either to an external source or to your group member. However, well done because this was a pleasure to look at.	8.5/10
Total			50

Total individual mark (weighted average)

$$= 50 / 60$$

= **83%** equivalent.
